UrsaNav
Follow the Stars!

- Enhanced Loran is an internationally-standardized positioning, navigation, and timing (PNT) service for use by many modes of transport and in other applications. It is the latest in the longstanding and proven series of low-frequency, LOng-RAnge Navigation (LORAN) systems, one that takes full advantage of 21st century technology.

- *eLoran* meets the accuracy, availability, integrity, and continuity performance requirements for **aviation** non-precision instrument approaches, **maritime** harbor entrance and approach maneuvers, **land-mobile** vehicle navigation, and location-based services, and is a precise source of **time and frequency** for applications such as telecommunications.

- *eLoran* is an independent, dissimilar, complement to Global Navigation Satellite Systems (GNSS). It allows GNSS users to retain the safety, security, and economic benefits of GNSS, even when their satellite services are disrupted.
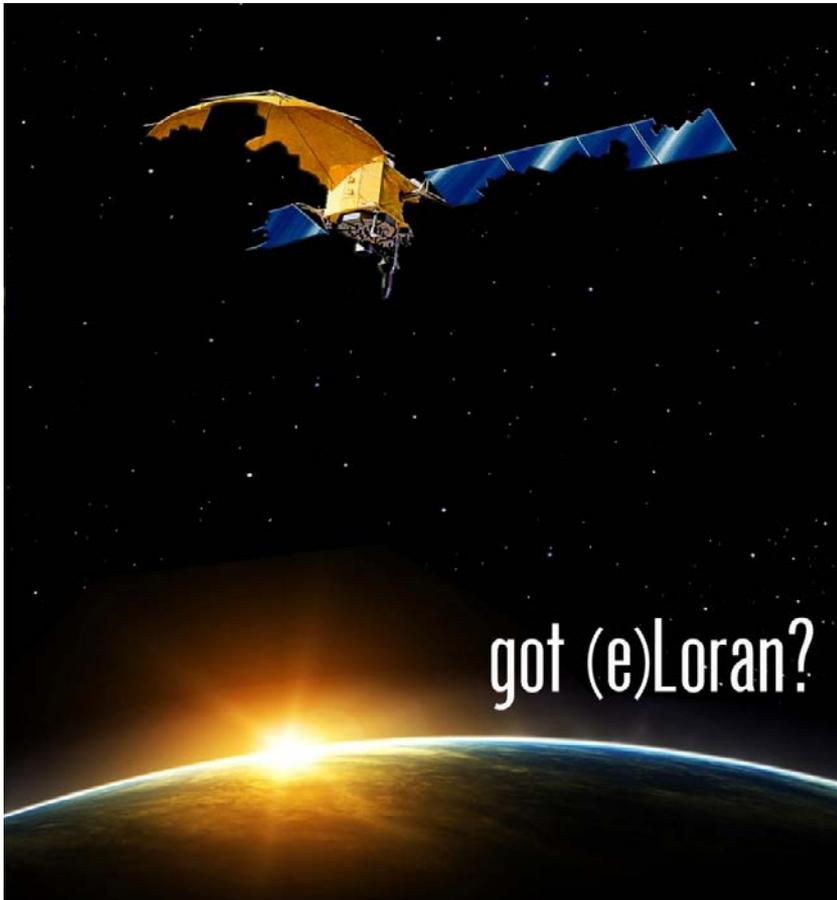

From eLoran Definition Document
International Loran Association November 2006

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

3

- The core *eLoran* system comprises modernized control centers, transmitting stations and monitoring sites. *eLoran* transmissions are synchronized to an identifiable, publicly-certified, source of Coordinated Universal Time (UTC) by a method wholly independent of GNSS. This allows the eLoran Service Provider to operate on a time scale that is synchronized with but operates independently of GNSS time scales. Synchronizing to a common time source will also allow receivers to employ a mixture of *eLoran* and satellite signals.

- The principal difference between *eLoran* and traditional Loran-C is the addition of a data channel on the transmitted signal. This conveys application-specific corrections, warnings, and signal integrity information to the user's receiver. It is this data channel that allows *eLoran* to meet the very demanding requirements of landing aircraft using non-precision instrument approaches and bringing ships safely into harbor in low-visibility conditions. *eLoran* is also capable of providing the exceedingly precise time and frequency references needed by the telecommunications systems that carry voice and internet communications.

UrsaNav
Follow the Stars!

- eLoran technology is built upon the foundation of Loran-C
- eLoran has been developed over the past decade as a response to the recognized vulnerability of GNSS, by international government agencies, industry and academia
- eLoran transmitter and receiving equipment makes full use of 21st century technology
- eLoran is recognized and recommended by the International Association of Lighthouse Authorities (IALA)
- eLoran receiver Minimum Performance Standards are being developed by the Radio Technical Commission of Maritime services (RTCM) Special Committee 127

5

# eLoran is <u>NOT</u> Simply Modernized Loran-C

got (e)Loran?

- requires a different timing strategy, control strategy, and new equipment to meet more stringent requirements
- specifies tighter timing tolerances
- transmissions are synchronized with respect to UTC (not SAM)
- employs a data channel for broadcast of application specific data
- includes Differential eLoran monitor stations and ASF maps to provide optimum accuracy in key areas (e.g. marine ports or airports)
- PROVEN TECHNOLOGY

Unaided Loran-C can <u>never</u> achieve the accuracy and integrity inherent in eLoran.

Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

6

- A properly configured and installed eLoran system can meet the following requirements

Application	Accuracy	Availability	Integrity	Continuity
Maritime Harbor Entrance and Approach (HEA)	**20 meters (95%)**	**0.998 over 2 years**	**10 seconds Time to Alarm**	**0.9997 over 3 hours**
Aviation Non-Precision Approach (RNP 0.3)	**0.3 Nautical Mile (556 meters)**	**0.999 – 0.9999**	**1×10^{-7} per hour**	**0.999 – 0.9999 over 150 seconds**
Timing	**Stratum-I frequency stability; timing to +/- 50 ns from UTC**

UrsaNav
Follow the Stars!

- # Core eLoran service
  - – eLoran transmitters provide a highly stable eLoran signal
  - – eLoran transmitters are autonomous, unmanned, self-controlled, self-supporting
  - – Signals are synchronized to an identifiable source of UTC (no SAM control)
  - – Monitor sites and Control centers do not interfere with the timing control of the transmitted signal

- # eLoran application service
  - – To improve accuracy and/or integrity application specific monitor stations provide augmentation data
  - – Application data is broadcast to the users over the Loran Data Channel (e.g. maritime differential corrections or aviation early skywave warnings)
  - – Application data are treated as corrections or integrity warnings and will not influence the delivery of the core eLoran service

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia
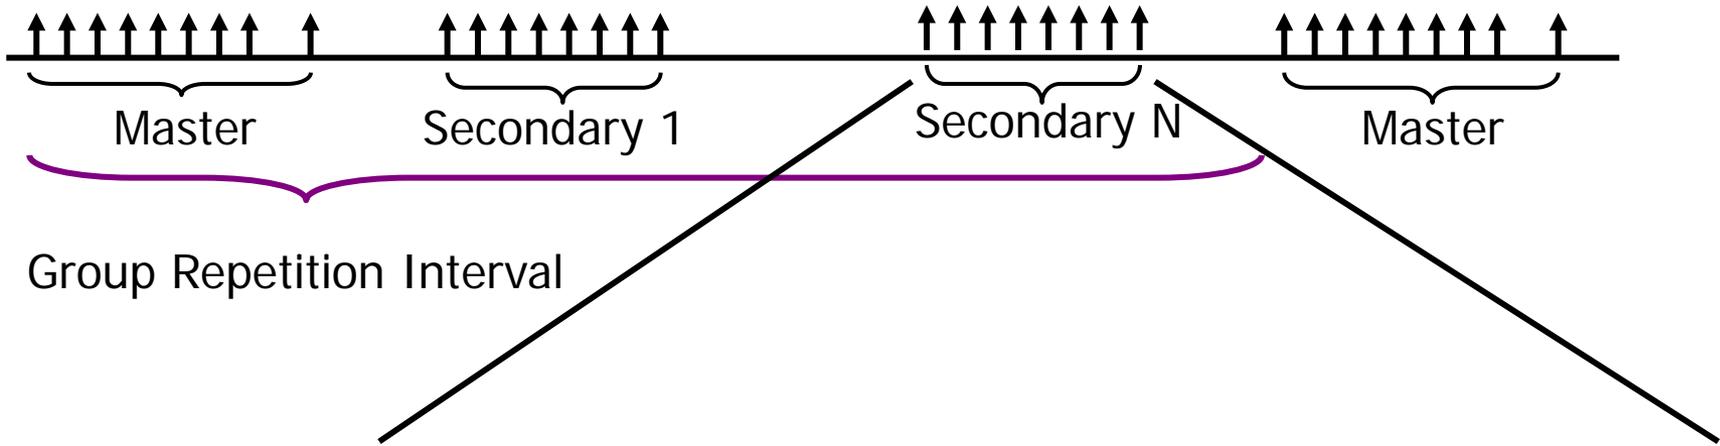

EMEA Operations
Bertem, Belgium

11

- The core eLoran service needs to provide signals with good geometry and signal strength in the maritime coverage area
- The Maritime Application service provider publishes an ASF map for the maritime coverage area, providing grid data with nominal propagation corrections per transmitter
- The Differential eLoran Reference Station provides real-time corrections on the nominal published ASFs for each transmitter through the Loran Data Channel
- The maritime user applies the ASFs from the map and differential corrections from the LDC to improve its positioning accuracy to better than 20 m (95%)
- The eLoran Integrity Monitor monitors the resulting eLoran accuracy and issues integrity warnings over the Loran Data Channel in case the service exceeds the horizontal protection limit

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

12

- The eLoran Signal in Space for the most part follows the specified Loran-C signal as published by the USCG, differences include:
  - eLoran specifies tighter synchronization to UTC, tighter timing tolerances between GRIs, between pulses and between zero-crossings in a pulse.
  - eLoran specifies tighter tolerances with respect to pulse shape
  - Time and frequency equipment apply phase corrections in a continuous manner instead of Local Phase Adjustments (LPA) of 10 or 20 ns steps.
  - eLoran uses Time of Transmission (synchronization to UTC) for all stations instead of Service Area Monitoring (SAM) timing control.
  - eLoran does not apply Blink anymore to indicate an out-of-tolerance condition. Integrity messages are conveyed through the LDC. In case of serious and harmful loss of synchronization, the transmitter will be take of the air.

100 kHz carrier

Amplitude (V) vs Time (μs)

- 90-110 kHz frequency band
- Pulsed signal with 100-kHz carrier frequency
- Groups of 8 pulses 1-ms spaced in TDMA structure
- Transmission of groups repeats every Group Repetition Interval (GRI)
- Up to 5 stations may share same GRI to form a chain
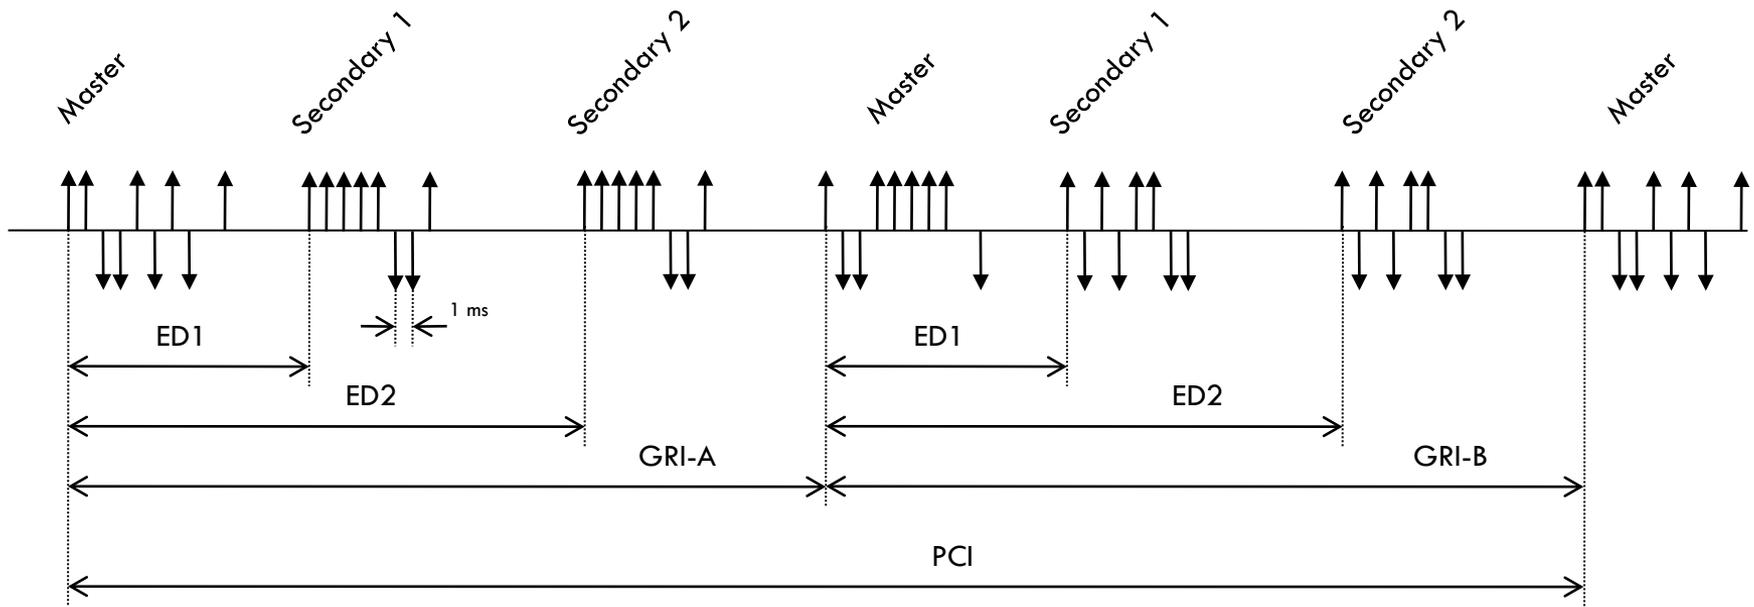

Master   Secondary 1   Secondary N   Master

Group Repetition Interval GRI

16

- The transmitted signals are phase coded (0 or 180⁰) for Master/Secondary identification and rejection of multiple hop skywaves.

↑ = 0° Carrier Phase
↓ = 180° Carrier Phase

ED = Emissions Delay (=Coding Delay + propagation time from Master to Secondary)
GRI = Group Repetition Interval (40 – 100 ms)
PCI = Phase Code Interval (80 – 200 ms)

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

**EMEA Operations**
Bertem, Belgium

17

- Improved phase codes
  - Phase codes should average to zero.
  - Pseudo-Random Noise (PRN) based phase codes will allow unique identification of a station in a group and will reduce cross-correlation of signals from other stations.
- The 9th Master pulse in the 10th pulse slot is no longer needed for identification and can be removed. This improves cross-rate interference and frees up the slot for the LDC.
- Waveforms can be improved over "standard" Loran-C.
- Shorter pulses allow for more navigation pulses, or room for more data. Navigation function is not degraded.
- Shorter pulses reduce negative cross-rate and skywave effects.

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

18

- Shorter pulses reduce the output power at the same levels of navigation signal power at the standard zero crossing.
- Shorter pulses are feasible and have been transmitted on air.

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

**EMEA Operations**
Bertem, Belgium

19

- Major difference between Loran-C and eLoran is the Loran Data Channel
- Data Channel carries
  - Differential eLoran Correction
  - UTC Time of day and date information
  - eLoran Integrity information
  - Differential GPS information
  - GPS integrity information
  - Other data
- Two implementations exist:
  - 3-state Pulse Position Modulation (Eurofix)
    - Standardised by RTCM and ITU
  - 9th Pulse Modulation

- To explain maritime ASF we need to understand:
  - Positioning using eLoran
  - eLoran signal propagation
  - Concept of ASFs and the ASF map
  - Concept of differential corrections

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

28

ρ_1

ρ_3

ρ_2

User position

- eLoran transmissions synchronised to UTC
- User receiver measures Time of Arrival to three (or more) transmitters
- Difference between Time of Arrival and Time of Transmission is the Propagation Delay Tprop
- TProp (in seconds) needs to be converted to a pseudo-range ρ (in meters) by multiplication with the speed of light (*c*) to calculate the user position

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

29

- A position calculation is based on 3 (or more) **pseudoranges** to 3 (or more) transmitters

- The receiver measures arrival **times**, which convert to **pseudoranges** by multiplication with the signals' propagation velocity

- This velocity is not equal to the speed of light in vacuum, but depends on the medium the signals travel in and over!

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

30

$$\rho = R + PF + SF + ASF + \delta + \varepsilon + B$$

Where

R = true range (what we want to know)
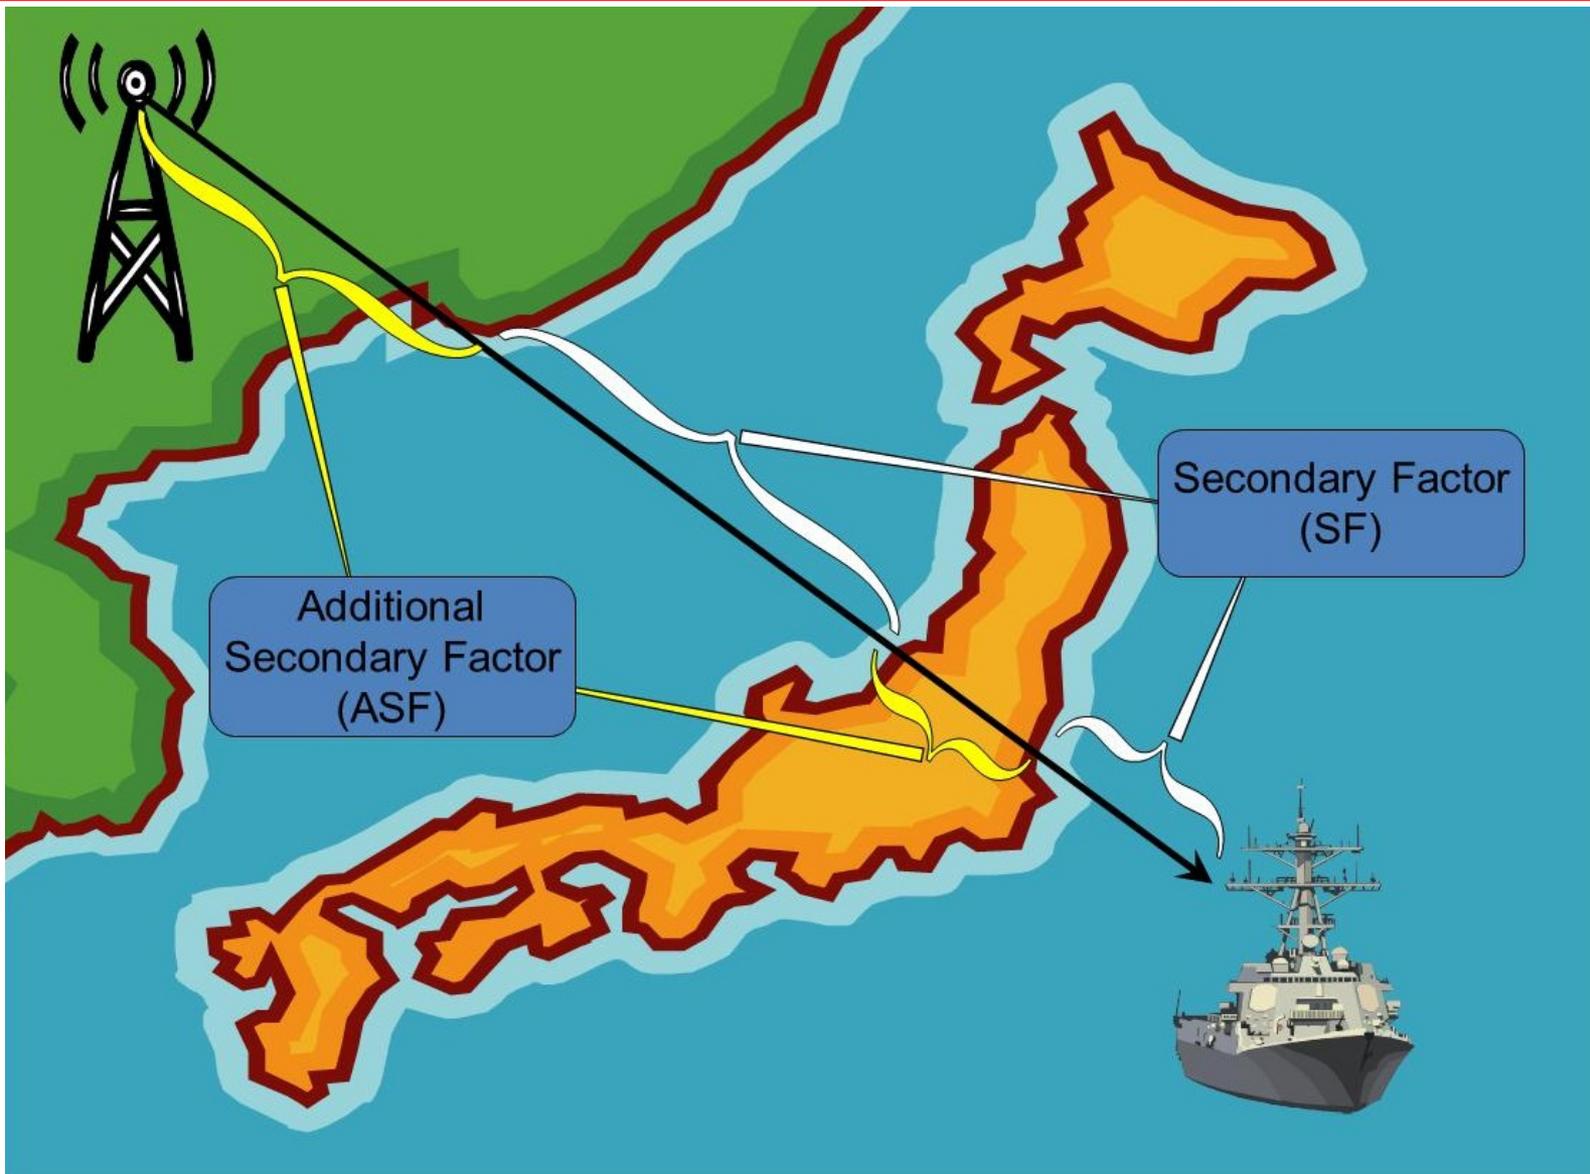

PF = Primary Factor

SF = Secondary Factor

ASF = Additional Secondary Factor

δ = variation in PF, SF and ASF

ε = remaining measurement errors

B = the receiver clock bias, solved in the position calculation

Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

31

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

**EMEA Operations**
Bertem, Belgium

32

- The Primary Factor delay is the difference between propagation of the signal in the earth's atmosphere as opposed to in free space

- The Secondary Factor delay accounts for signal propagation over sea-water

- PF and SF are known and considered constant, the receiver uses a model to calculate the delays

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia
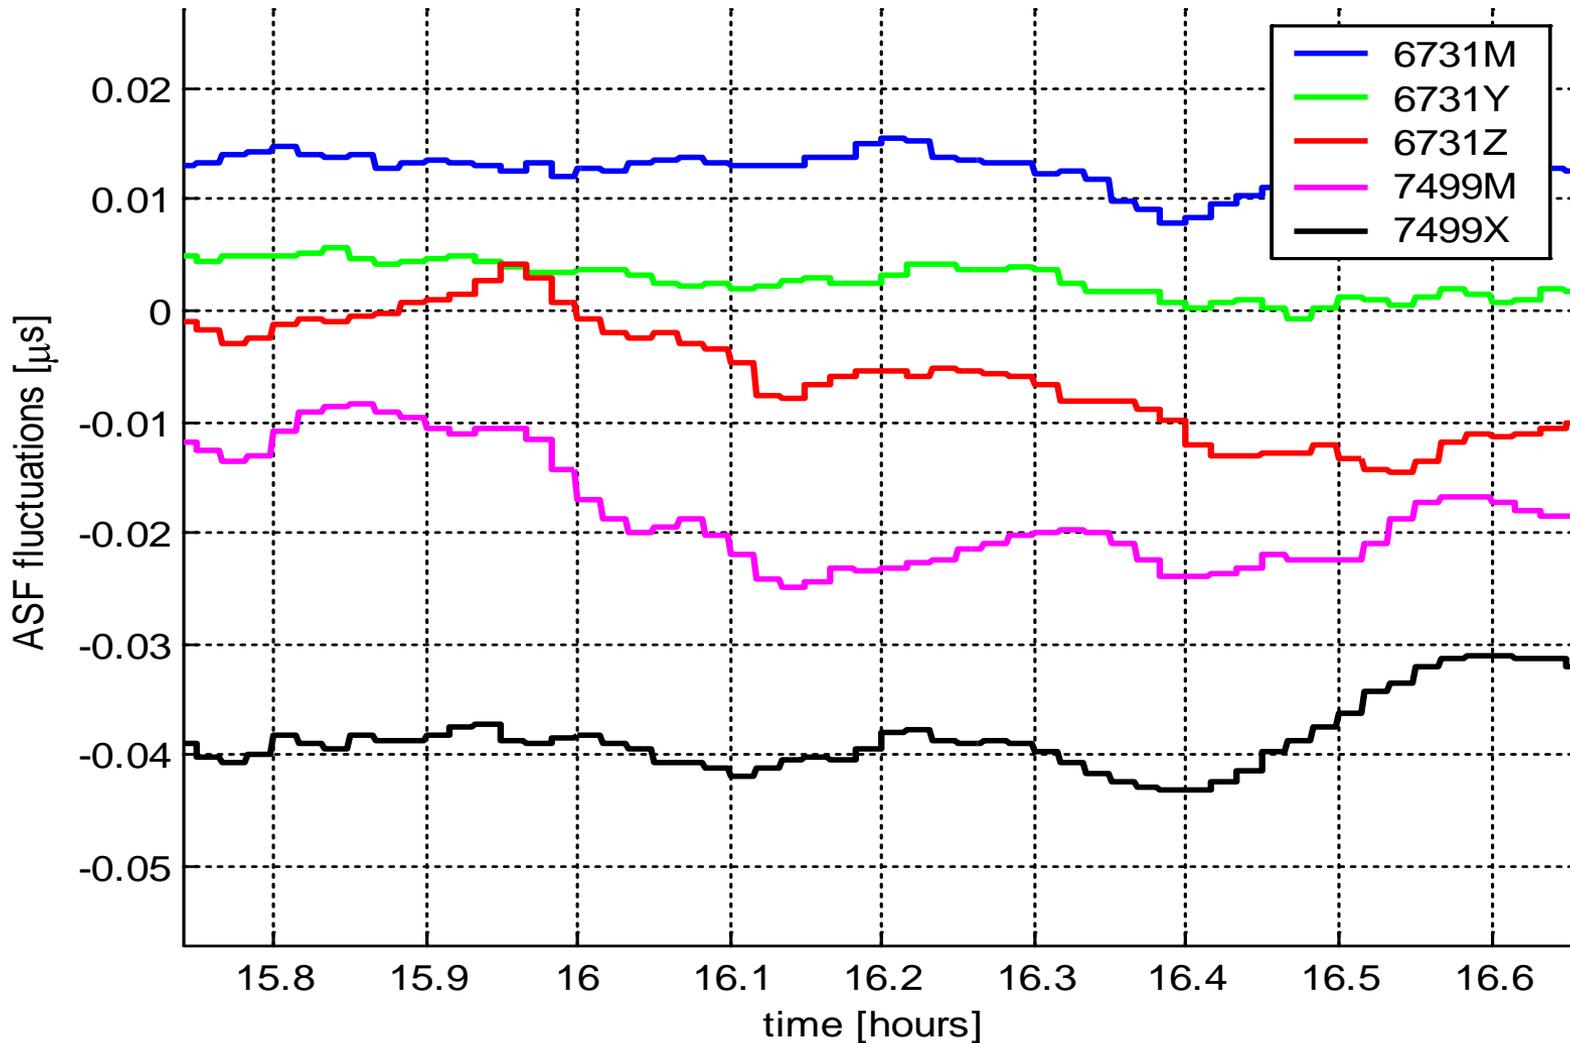

EMEA Operations
Bertem, Belgium

33

- The Additional Secondary Factor is the delay caused by signal propagation over land and elevated terrain as opposed to over sea-water

- The ASF delay build-up depends on the type of soil

- The ASF delay is the total cumulative delay the signal experiences of sections with different ground conductivity

- The Maritime service provider publishes an ASF map for the operating area as a grid with surveyed nominal ASFs for each transmitter

- Not taking ASFs into account may result in positioning errors of several 100 meters to kilometers

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

34

- ## ASFs are published as a map with an ASF grid for each transmitter

picture courtesy of the General Lighthouse Authorities of the UK and Ireland

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

- ASFs are relatively constant in time

- Any variation in ASF due to weather, water vapor, air pressure, seasonal influences is captured in δ

- δ also contains any misalignment of the transmitter timing wrt UTC

- δ is unknown, but can be measured by a reference station at a known and fixed location

- In differential eLoran, these corrections are broadcast to the users to improve their positioning and UTC time accuracy

- The Differential eLoran user calculates position based on:
  - eLoran range measurements
  - Corrected with modeled PF and SF
  - Corrected with ASF map values for the estimated location
  - Corrected with differential corrections coming from eLoran Reference Station broadcast from eLoran transmitter
    - Differential corrections compensate for changes in ASF map data and possible transmitter timing errors

Washington DC Metropolitan Area
Leesburg, Virginia

Corporate Headquarters
Chesapeake, Virginia

EMEA Operations
Bertem, Belgium

39

$$R + \varepsilon = (\rho - PF - SF - ASF - \delta - B)$$

Where
  R = true range (what we want to know)
  PF = Primary Factor (modeled)
 SF = Secondary Factor (modeled)
 ASF = Additional Secondary Factor (published)
  δ = differential correction (broadcast)
 B = clock error bias (solved in positioning)
  ε = remaining measurement errors

Remaining errors ε, such as noise and interference cause the calculated position to deviate from the real position
